

This plugin can be used for the [uDMX Transmitter](#) hardware with [DMXControl](#)

IMPORTANT:

This plugin needs libusb

( <http://libusb-win32.sourceforge.net/> )

for compiling. So install this first.

As the Borland C-Builder seems to have its own file `usb.h` make a copy of the libusb-wins `usb.h` and rename it to `usb_DMX.h`. Otherwise you might get some problems compiling the software.

Borland C-Builder generates some files from the imported type-libs.

In `DMXCTypeLib_TLB.h` there should be a line like

```
__property TOLEBOOL IsFreezed = {read = get_IsFreezed/*, write = set_IsFreezed*/};
```

This line is generated with a read and write function, but the write function does NOT exist. Just uncomment the line and you should be able to compile the files.

At this time there is no possible configuration for the plugin so just copy it in the DMXControls main directory and use it. I only tested the plugin with DMXControl Version 2.9.

Hope someone except me can make use of the

Love and Light

Lutz ([ilLUTZminator@users.sourceforge.net](mailto:ilLUTZminator@users.sourceforge.net))
